PROFESSIONAL SUMMARY

- Full-stack software developer and systems engineer focused on production-oriented web applications and connected IoT hardware ecosystems.
- Experience designing relational PostgreSQL databases, modular REST APIs, React interfaces, secure authentication/authorization flows, and embedded telemetry systems.
- Built and hardened THEIAKSHI ONE, a multi-module enterprise HRMS with organization-level isolation, RBAC, geofenced attendance, work planning, reporting, audit logging, and Docker/deployment infrastructure.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, C++, SQL, HTML5, CSS3

Frontend: React, Vite, Tailwind CSS, Responsive Design, WebGL / Three.js

Backend & API: Node.js, Express, RESTful API Architecture

Database: PostgreSQL, Relational Schema Design, SQL Migrations

Embedded & IoT: Arduino, ESP8266 / ESP32, Sensor Interfacing, Hardware Prototyping

Tools: Git, GitHub, Docker, Postman, Linux / Bash

PROJECTS & ENGINEERING EXPERIENCE

THEIAKSHI ONE — Enterprise HRMS | Full-Stack Systems Project | React, Node.js, Express, PostgreSQL, Docker

[GitHub: github.com/keenu2004-ai/RANSOM](https://github.com/keenu2004-ai/RANSOM)

- Architected a 3-tier enterprise HRMS with organization-level data isolation, modular REST APIs, and a 35-table PostgreSQL relational schema.
- Implemented employee, attendance, leave, expenses, work planning/timesheets, assets, holidays, notifications, reports, files, dashboards, and audit-log workflows.
- Engineered geofenced attendance with branch locations, punch coordinates, working-hours tracking, breaks, late/overtime status, and attendance regularization.
- Built secure identity architecture separating USER, EMPLOYEE, and ROLE concepts, with server-side RBAC, permission-aware frontend controls, and object-level authorization hardening.
- Hardened authentication with HTTP-only JWT cookies, database-backed auth_version session invalidation, Microsoft SSO validation, CSRF/CORS controls, and rate limiting.
- Added migration/integrity tooling, Docker deployment configuration, backup tooling, CI/CD support, structured API errors, and production-readiness hardening.

FITZONE GYM — Full-Stack Web Application | Business Management Platform | React, Node.js, REST APIs, Responsive UI

[Live Demo: gym-web-frontend-six.vercel.app](https://gym-web-frontend-six.vercel.app)

- Built a responsive gym management platform with membership workflows, class booking, trainer interfaces, and administrative dashboards.
- Designed a decoupled frontend/backend structure focused on practical business workflows and mobile-friendly interaction.

PhonePe Clone — Frontend UI Replication | Responsive Frontend | React, HTML5, CSS3

[GitHub: keenu2004-ai repositories](https://github.com/keenu2004-ai/repositories)

- Reconstructed a high-fidelity PhonePe web interface with responsive layouts, semantic structure, reusable styling patterns, and close visual reproduction.
- Built the interface without external UI component libraries to demonstrate direct control over layout, spacing, typography, and responsive behavior.

HARDWARE & IOT ENGINEERING

Solar PV Defect Detection — IoT Prototype | Embedded Hardware System | ESP8266, Embedded C++, Sensors, Wi-Fi

- Engineered an ESP8266-based prototype that processes analog sensor inputs and applies threshold-based logic for real-time photovoltaic fault identification.
- Implemented Wi-Fi telemetry pipelines to transmit live sensor measurements to JSON-driven remote web dashboards.

ARDUMIST — Automated Humidifier | Hackathon Prototype · Technopheilia | Arduino UNO, DHT11, Relay, OLED, C

- Prototyped an automated greenhouse micro-climate misting system that monitors humidity and activates a spray mechanism when levels fall below 75%.
- Implemented hysteresis control to prevent relay chatter and a scheduled forced 10-minute activation cycle for consistent operation.
- Integrated an OLED display for real-time humidity/temperature feedback and completed the hardware-software loop under 48-hour hackathon constraints.

EDUCATION

ABES Engineering College, Ghaziabad (AKTU) 2022 – 2026

B.Tech in Electronics & Communication Engineering | CGPA: 7.2

D.A.V. Public School 2021 – 2022

Class XII | Percentage: 77.9%

D.A.V. Public School 2019 – 2020

Class X | Percentage: 77.8%

ENGINEERING FOCUS

- Embedded systems, signal processing, digital electronics, data structures, software engineering, relational data modeling, and connected hardware systems.

SELECTED ENGINEERING STRENGTHS

- Full-stack ownership: translating a business workflow into frontend interfaces, backend APIs, database structures, and deployment configuration.
- Security-first implementation: authentication, RBAC, tenant isolation, object-level authorization, CSRF/CORS controls, rate limiting, and session invalidation.
- Data-centric backend engineering: relational schema design, parameterized SQL repositories, migrations, referential integrity, and reporting/export workflows.
- Hardware-software integration: sensor acquisition, threshold/hysteresis control, actuator logic, Wi-Fi telemetry, and remote dashboard communication.
